

## [BD] HW3-2 Analysis

Once again, the results public URL can be found in the readme.

The results make some sense to us. Query A- Usually users follow people they know or celebrities, 1K outbound is high. Query B- Celebrities have millions inbound on the full network, so 3K makes sense. Query C- Many of the same nodes from Query B are present here, so I have faith in the results. Query D- 12 seemed small in a large network. Query E- Unsure how the triangle count is so huge relative to the number of nodes.
